

Machine Learning

# Application example: Photo OCR

---

## Problem description and pipeline

# The Photo OCR problem

# Photo OCR pipeline

→ 1. Text detection

→ 2. Character segmentation

→ 3. Character classification

~~Cleaning~~ → ~~Cleaning~~

# Photo OCR pipeline

Machine Learning

Application example:  
Photo OCR

---

Sliding windows

## Text detection

## Pedestrian detection

# Supervised learning for pedestrian detection

$x$  = pixels in 82x36 image patches

1,000  
10,000  
...

Positive examples ( $y = 1$ )

Negative examples ( $y = 0$ )

# Sliding window detection

step-size / stride

# Sliding window detection

# Sliding window detection

# Sliding window detection

# Text detection

# Text detection

Positive examples ( $y = 1$ )

Negative examples ( $y = 0$ )

# Text detection

"expansion"

# 1D Sliding window for character segmentation

Positive examples ( $y = 1$ )

Negative examples ( $y = 0$ )

# Photo OCR pipeline

→ 1. Text detection

→ 2. Character segmentation

→ 3. Character classification

Machine Learning

# Artificial data synthesis for photo OCR

Real data

Synthetic data

# Synthesizing data by introducing distortions

# Synthesizing data by introducing distortions: Speech recognition

Original audio: 

Audio on bad cellphone connection

Noisy background: Crowd

Noisy background: Machinery

## Synthesizing data by introducing distortions

- Distortion introduced should be representation of the type of noise/distortions in the test set.

- Audio:  
Background noise,  
bad cellphone connection

- Usually does not help to add purely random/meaningless noise to your data.

- $x_i$  = intensity (brightness) of pixel  $i$
- $x_i \leftarrow x_i + \text{random noise}$

## Discussion on getting more data

1. Make sure you have a low bias classifier before expending the effort. (Plot learning curves). E.g. keep increasing the number of features/number of hidden units in neural network until you have a low bias classifier.
2. “How much work would it be to get 10x as much data as we currently have?”
  - Artificial data synthesis
  - Collect/label it yourself
  - “Crowd source” (E.g. Amazon Mechanical Turk)

→ #hours?  $n = 1,000$   
→ 10 secs/example  $n = 10,000$  ←

Ceiling analysis: What  
part of the pipeline to  
work on next

## Estimating the errors due to each component (ceiling analysis)

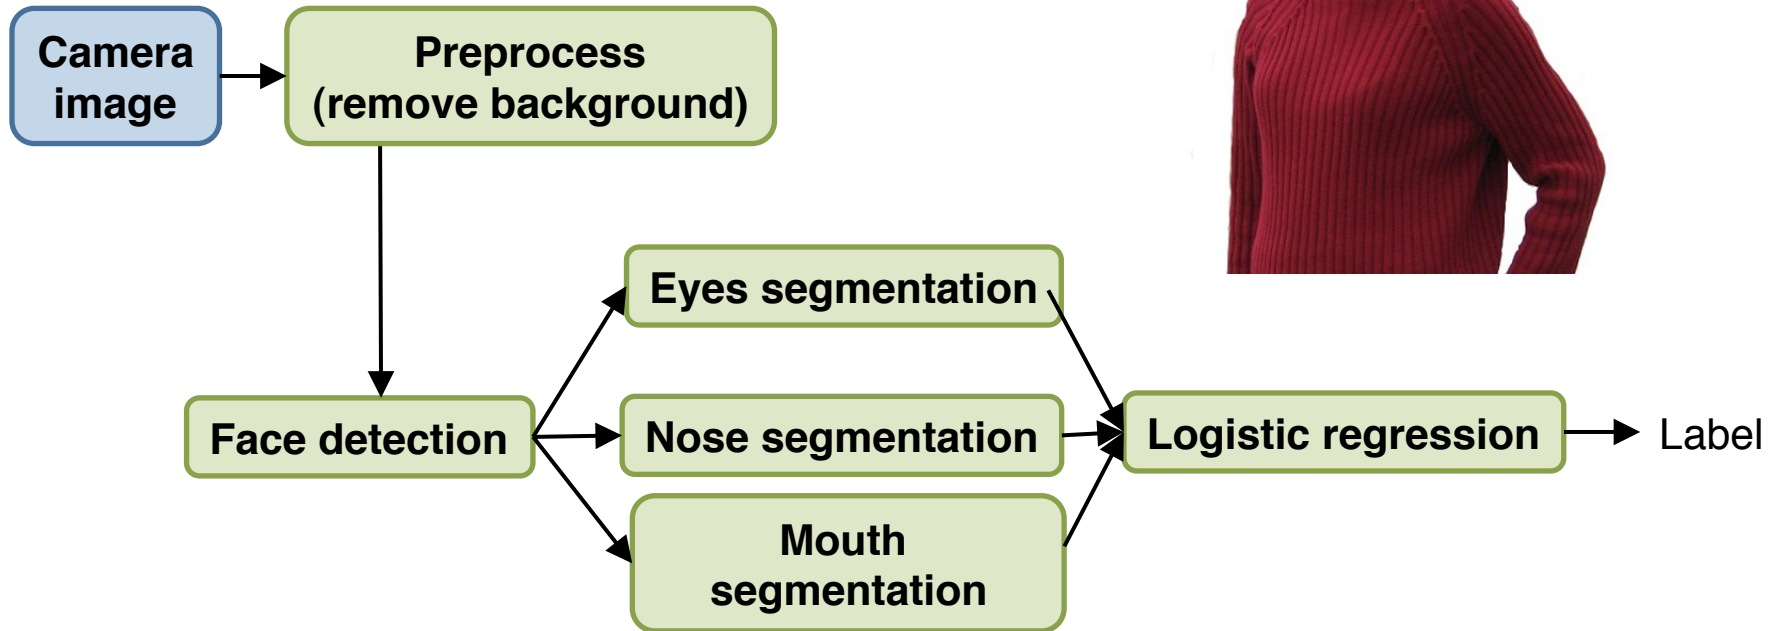

What part of the pipeline should you spend the most time trying to improve?

Component	Accuracy
Overall system	72%
→ Text detection	89%
Character segmentation	<u>90%</u>
Character recognition	100%

Handwritten blue annotations on the table: Arrows point from the right to each row. Vertical arrows on the right indicate the drop in accuracy between components: 17% from Overall system to Text detection, 1% from Text detection to Character segmentation, and 10% from Character segmentation to Character recognition.

# Another ceiling analysis example

Face recognition from images  
(Artificial example)
