

## Logistic Regression

## Classification

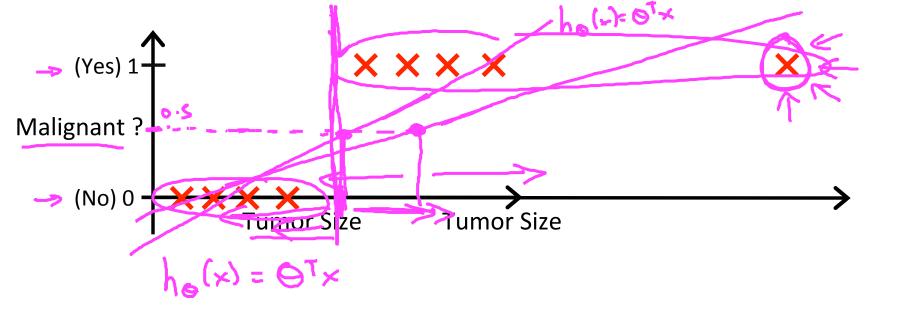

Machine Learning

#### Classification

- → Email: Spam / Not Spam?
- → Online Transactions: Fraudulent (Yes / No)?
- > Tumor: Malignant / Benign?

$$y \in \{0,1\}$$
 0: "Negative Class" (e.g., benign tumor)
1: "Positive Class" (e.g., malignant tumor)
$$y \in \{0,1\}$$

$$y \in \{0,1,2,3\}$$

 $\rightarrow$  Threshold classifier output  $h_{\theta}(x)$  at 0.5:

$$\longrightarrow$$
 If  $h_{\theta}(x) \geq 0.5$ , predict "y = 1"

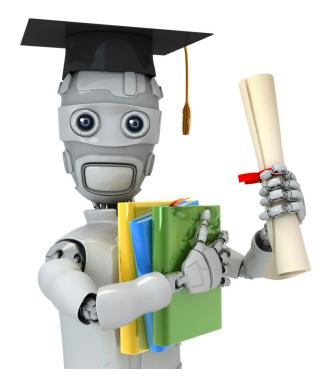

If  $h_{\theta}(x) < 0.5$  , predict "y = 0"

Classification: 
$$y = 0$$
 or 1

$$h_{\theta}(x)$$
 can be  $\geq 1$  or  $\leq 0$ 

Logistic Regression: 
$$0 \le h_{\theta}(x) \le 1$$

Classification

**Machine Learning** 

## Logistic Regression

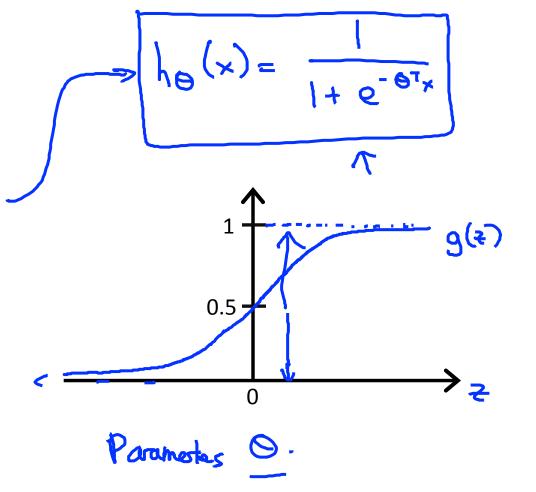

Hypothesis Representation

#### **Logistic Regression Model**

Want 
$$0 \le h_{\theta}(x) \le 1$$

$$h_{\theta}(x) = \mathbf{g}(\theta^T x)$$

Sigmoid functionLogistic function

#### **Interpretation of Hypothesis Output**

$$h_{\theta}(x)$$
 = estimated probability that  $y = 1$  on input  $x \leftarrow$ 

Example: If 
$$x = \begin{bmatrix} x_0 \\ x_1 \end{bmatrix} = \begin{bmatrix} 1 & 1 \\ \text{tumorSize} \end{bmatrix}$$

Tell patient that 70% chance of tumor being malignant

$$h_{\Theta}(x) = P(y=1|x;\Theta)$$

$$y = 0 \text{ or } 1$$

"probability that y = 1, given x, parameterized by  $\theta$ "

$$P(y = 0 | y) + P(y = 1 | y) = 1$$

$$P(y = 0 | x; \theta) = 1 - P(y = 1 | x; \theta)$$

#### Machine Learning

## Logistic Regression

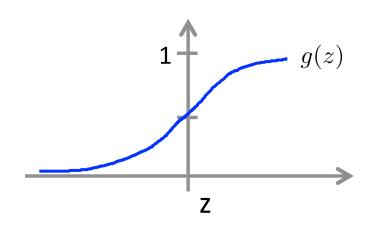

Decision boundary

#### **Logistic regression**

$$h_{\theta}(x) = g(\theta^T x)$$
$$g(z) = \frac{1}{1 + e^{-z}}$$

Suppose predict "
$$y=1$$
" if  $h_{\theta}(x) \geq 0.5$ 

predict "
$$y=0$$
" if  $h_{\theta}(x)<0.5$ 

#### **Decision Boundary**

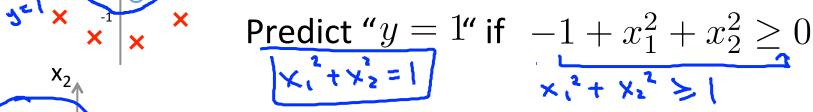

$$h_{\theta}(x) = g(\theta_0 + \underline{\theta}_1 x_1 + \underline{\theta}_2 x_2)$$
Decision boundary

Predict "
$$y = 1$$
" if  $-3 + x_1 + x_2 \ge 0$ 

$$X_1 + X_2 = 3$$
  
 $X_1 + X_2 = 3$ 

OTX

#### Non-linear decision boundaries

$$h_{\theta}(x) = g(\theta_0 + \theta_1 x_1 + \theta_2 x_2 + \theta_3 x_1^2 + \theta_4 x_1^2 x_2 + \theta_5 x_1^2 x_2^2 + \theta_6 x_1^3 x_2 + \dots)$$

## Logistic Regression

### Cost function

**Machine Learning** 

**Training** set:

$$\{\underline{(x^{(1)},y^{(1)}),(x^{(2)},y^{(2)}),\cdots,(x^{(m)},y^{(m)})}\}$$

$$h_{\theta}(x) = \frac{1}{1 + e^{-\underline{\theta}^T x}}$$

How to choose parameters  $\theta$ ?

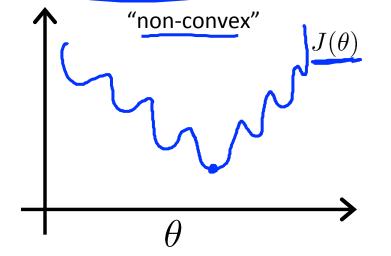

#### **Cost function**

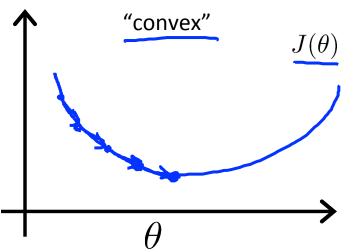

→ Linear regression:

$$J(\theta) = \frac{1}{m} \sum_{i=1}^{m} \frac{1}{2} \left( h_{\theta}(x^{(i)}) - y^{(i)} \right)^{2}$$

costlhe

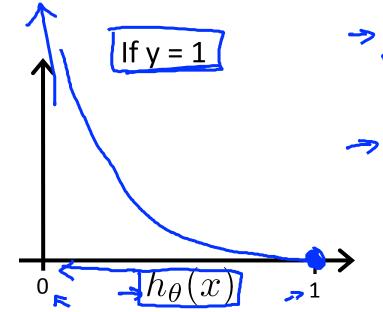

$$\operatorname{Cost}(h_{\theta}(x^{\bullet}), y^{\bullet}) = \frac{1}{2} \left( h_{\theta}(x^{\bullet}) - y^{\bullet} \right)^{2} \longleftarrow$$

#### **Logistic regression cost function**

$$Cost(h_{\theta}(x), y) = \begin{cases} -\log(h_{\theta}(x)) & \text{if } y = 1\\ -\log(1 - h_{\theta}(x)) & \text{if } y = 0 \end{cases}$$

Cost = 0 if 
$$y = 1$$
,  $h_{\theta}(x) = 1$   
But as  $h_{\theta}(x) \to 0$   
 $Cost \to \infty$ 

Captures intuition that if  $h_{\theta}(x) = 0$ , (predict  $P(y = 1|x; \theta) = 0$ ), but y = 1, we'll penalize learning algorithm by a very large cost.

#### **Logistic regression cost function**

Machine Learning

## Logistic Regression

Simplified cost function and gradient descent

#### Logistic regression cost function

#### Logistic regression cost function

$$J(\theta) = \frac{1}{m} \sum_{i=1}^{m} \text{Cost}(h_{\theta}(x^{(i)}), y^{(i)})$$
$$= \frac{1}{m} \left[ \sum_{i=1}^{m} y^{(i)} \log h_{\theta}(x^{(i)}) + (1 - y^{(i)}) \log (1 - h_{\theta}(x^{(i)})) \right]$$

To fit parameters  $\theta$ :

$$\min_{\theta} J(\theta)$$
 Great  $\Theta$ 

To make a prediction given new x:

Output 
$$h_{\theta}(x) = \frac{1}{1 + e^{-\theta^T x}}$$

#### **Gradient Descent**

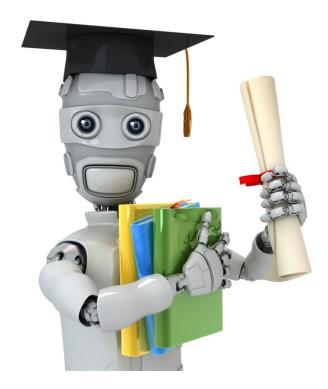

$$J(\theta) = -\frac{1}{m} \left[ \sum_{i=1}^{m} y^{(i)} \log h_{\theta}(x^{(i)}) + (1 - y^{(i)}) \log (1 - h_{\theta}(x^{(i)})) \right]$$

Want  $\min_{\theta} J(\theta)$ :

#### **Gradient Descent**

$$J(\theta) = -\frac{1}{m} [\sum_{i=1}^{m} y^{(i)} \log h_{\theta}(x^{(i)}) + (1 - y^{(i)}) \log (1 - h_{\theta}(x^{(i)}))]$$
 Want  $\min_{\theta} J(\theta)$ :
$$\theta_{j} := \theta_{j} - \alpha \sum_{i=1}^{m} h_{\theta}(x^{(i)}) - y^{(i)} x_{j}^{(i)}$$
 (simultaneously update all  $\theta_{j}$ )
$$h_{\theta}(x) = \frac{1}{1 + e^{-\delta T_{x}}}$$

Algorithm looks identical to linear regression!

Machine Learning

# Logistic Regression

# Advanced optimization

#### **Optimization algorithm**

Cost function  $\underline{J(\theta)}$ . Want  $\min_{\theta} J(\theta)$ .

Given  $\theta$ , we have code that can compute

$$\rightarrow -J(\theta)$$

$$o$$
 -  $rac{\partial}{\partial heta_j} J( heta)$  (for  $j=0,1,\ldots,n$  )

Gradient descent:

Repeat {

$$\rightarrow \theta_j := \theta_j - \alpha \frac{\partial}{\partial \theta_j} J(\theta)$$

#### **Optimization algorithm**

Given  $\theta$ , we have code that can compute

#### Optimization algorithms:

- Gradient descent
  - Conjugate gradient
  - BFGS
  - L-BFGS

#### Advantages:

- No need to manually pick  $\alpha$
- Often faster than gradient descent.

#### Disadvantages:

More complex

```
Example: Min 3(0)
\theta = \begin{bmatrix} \theta_1 \\ \theta_2 \end{bmatrix} \quad 0 = 5, 0 = 5.
                                                  function [jVal, gradient]
                                                                   = costFunction(theta)
                                                      jVal = (\underline{theta(1)-5)^2} + \dots
                                                                  (theta(2)-5)^2;
J(\theta) = (\theta_1 - 5)^2 + (\theta_2 - 5)^2
                                                      gradient = zeros(2,1);
\rightarrow \frac{\partial}{\partial \theta_1} J(\theta) = 2(\theta_1 - 5)
                                                     gradient(1) = 2*(theta(1)-5);
                                                    rac{1}{2} gradient(2) = 2*(theta(2)-5);
\rightarrow \frac{\partial}{\partial \theta_2} J(\theta) = 2(\theta_2 - 5)
-> options = optimset(\(\frac{\text{GradObj', \text{\on'}}{\text{on'}}\), \(\text{MaxIter', \text{\on'}}{\text{100'}}\);
\rightarrow initialTheta = zeros(2,1);
  [optTheta, functionVal, exitFlag] ...
        = fminunc(@costFunction, initialTheta, options);
                                           Och d>2
```

theta = 
$$\begin{bmatrix} \theta_0 \\ \theta_1 \\ \vdots \\ \vdots \\ \theta_n \end{bmatrix}$$
 theta(1)

function (jVal) gradient) = costFunction (theta)

gradient(n+1) = [code to compute  $\frac{\partial}{\partial \theta_n} J(\theta)$ 

Machine Learning

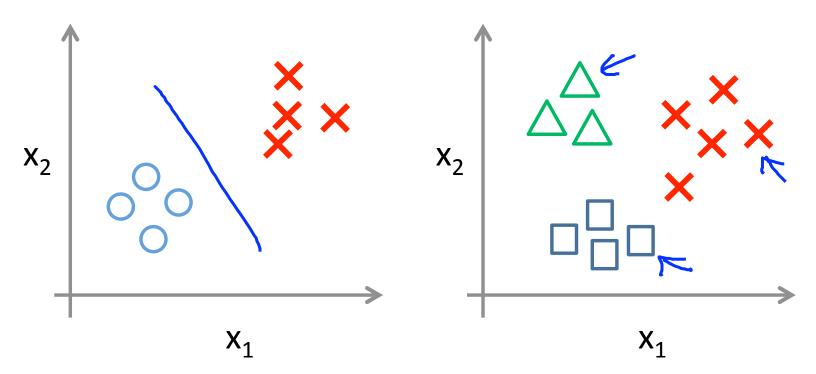

## Logistic Regression

Multi-class classification: One-vs-all

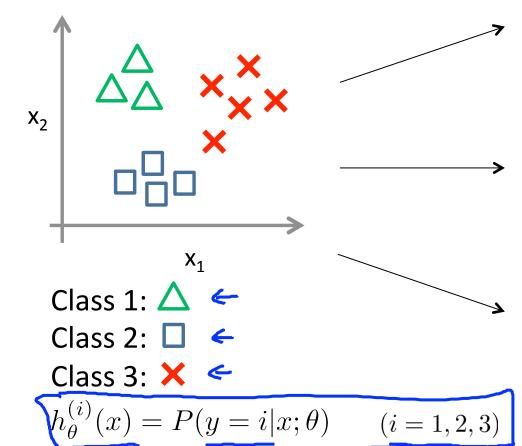

#### **Multiclass classification**

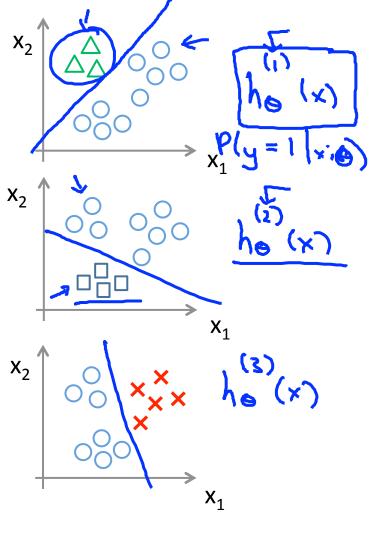

Binary classification:

Multi-class classification:

#### One-vs-all (one-vs-rest):

#### **One-vs-all**

Train a logistic regression classifier  $h_{\theta}^{(i)}(x)$  for each class  $\underline{i}$  to predict the probability that  $\underline{y}=\underline{i}$ .

On a new input  $\underline{x}$ , to make a prediction, pick the class i that maximizes

$$\max_{\underline{i}} h_{\theta}^{(i)}(x)$$
